Reconsidering tracing in Ceph

Mohamad Gebai
Software Engineer at SUSE
@moge

Outline

- Vector vs list vs deque in bufferlist
- push_back()
- to_str()
- push_front()
- Tracing demo

Hypothesis

- Will changing the data structure behind bufferlist help performance?
- Will moving from a `std::list` to a `std::vector` make bufferlist more cache-friendly?
- rados bench isn't targeted enough, improvement is too little to notice
- Solution: why not use tracing?

Code instrumentation

```
void buffer::list::push_front(ptr& bp) {  
    if (bp.length() == 0)  
        return;  
    tracepoint(analyze, bufferlist_push_front, ENTER);  
    _buffers.insert(_buffers.begin(), bp);  
    tracepoint(analyze, bufferlist_push_front, EXIT);  
  
    _len += bp.length();  
}
```

Code instrumentation

- We can add PMU counters in the context of each tracepoint

```
$> lttng create -o .
```

```
[...]
```

```
$> lttng add-context -u -t perf:thread:cache-misses -t perf:thread:dTLB-load-misses -t  
perf:thread:L1-dcache-load-misses -t perf:thread:instructions
```

- Instructions can let us guess which code paths are taken (slow path vs fast path)

Access latency

- 1000 bufferlists
- 1000 buffer per bufferlist
- Vary buffer size
- Run push_back(), push_front() and to_str() workloads
- L1 cache size: 32 KB
- L2 cache size: 256 KB
- **Microbenchmarks in unit tests**

push_back() latency

push_back() latency

Buffer size = 1.0KiB

push_back() latency

Buffer size = 4.0KiB

push_back() latency

Buffer size = 8.0KiB

push_back() latency

Buffer size = 16.0KiB

push_back() latency

Buffer size = 32.0KiB

push_back() latency

Buffer size = 64.0KiB

push_back() latency

Buffer size = 128.0KiB

push_back() latency

Buffer size = 256.0KiB

push_back() latency

Buffer size = 512.0KiB

To str() latency

To str() latency

Buffer size = 1.0KiB

To str() latency

Buffer size = 1.0KiB

To str() latency

Buffer size = 4.0KiB

To str() latency

Buffer size = 8.0KiB

To str() latency

Buffer size = 16.0KiB

To str() latency

Buffer size = 32.0KiB

To str() latency

Buffer size = 64.0KiB

To str() latency

Buffer size = 128.0KiB

To str() latency

Buffer size = 256.0KiB

To str() latency

Buffer size = 512.0KiB

Push front latency

Buffer size = 512.0KiB

push_front() latency

push_front() latency

Buffer size = 1.0KiB

push_front() latency

Buffer size = 4.0KiB

push_front() latency

Buffer size = 8.0KiB

push_front() latency

Buffer size = 16.0KiB

push_front() latency

Buffer size = 32.0KiB

push_front() latency

Buffer size = 64.0KiB

push_front() latency

Buffer size = 128.0KiB

push_front() latency

Buffer size = 256.0KiB

push_front() latency

Buffer size = 512.0KiB

What else?

- LLC misses
- Store cache misses
- Branch prediction misses! (interesting for vector<> and deque<>)
- Page faults
 - + minor and major
 - + all data structures are similar in a microbenchmark

Trace Compass demo

```
$> ./do_cmake -DWITH_LTTNG=ON -  
DWITH_OSD_INSTRUMENT_FUNCTIONS=ON
```

Or simply

```
$> ./do_cmake
```

- The best part: no instrumentation required
- Works with kernel traces from ftrace
- Works with profiling data from perf

Trace Compass demo
